TITLE: To Increase the Durability of Shot Boring Bits (Povysheniye stoykosti drobovykh koronok)

PERIODICAL: Razvedka i okhrana nedr, 1958, Nr 12, pp 24-31 (USSR)

ABSTRACT: The Sverdlovsk Mining Institute conducted extensive tests with different shot boring bits to establish the main factors which increase the resistance to wear of the bits under different geological conditions. These factors are: 1) the influence of the hardness of shot boring bits on the drilling speed; 2) the influence of the chemical composition of these bits on their resistance to wear and on the drilling speed; and 3) the influence of the shape of the bits on their resistance to wear and on the drilling speed (See Graphics 1 to 7). The following conclusions were reached: 1) in the drilling of bore holes with tempered steel shots, the boring bits must have vertical rectangular indentations. They are most simple to manufacture, maintain constant pressure on the rock and increase drilling speed; 2) the drilling speed depends on the shape of the indentation, its width and height

Card 1/2

To Increase the Durability of Shot Boring Bits

SOV/132-58-12-4/14

and also on the thickness of the walls and the hardness of the metal of the bit. Bits with a rectangular indentation and with 10 - 12 mm thick walls give the best results; 3) the basic parameters of the bit must be as follows: a) a rectangular 150 - 200 mm high and  $1/4 - 1/8 \pi D$  wide indentation; b) the walls of the bit must be 10 - 12 mm thick; c) the total height of the bit must be 250 - 300 mm; 4) the shot boring bits must be made from steel of the brands U12S, 30KhGS, 40Kh and 45, tempered for a metal strength of 25 - 30 HRC.

There are 7 graphs, 1 table and 10 Soviet references.

Title : Which Apple Tree Varieties Should be Cultivated in Lithuania ?

Orig Pub : Soc. Zemes ukis, 1956, No 10, 17-22.

Abstract : Apple trees constituted 60% of all fruit trees in Lithuania according to the data obtained in 1952. The breakdown of these apple trees was as follows: summer varieties: 19%, fall varieties: 60% and winter varieties: 21%. It is recommended to grow apples in the following proportions: summer varieties: 10-15%; fall varieties: 15-25% and winter varieties: 60-70%. The percentage of apple trees in the total fruit crop should be increased up to 30%. It is recommended that one cultivate 37 varieties in Lithuania and avoid too great diversity of varieties.

Abstract: Clinical and epizootic data about several outbreaks in farms in the neighborhood of Moscow 1959-1962: in one large farm producing several tens of thousands of ducklings yearly, successive waves of the epizootic killed nearly 30% of 8200, 47% of 8200, 69% of 2134. Macerates of either liver or brain of dead birds were highly infective; details about experimental studies. Both passive and active (to break cycle of transmission through the eggs) vaccination are now carried out.

KONTSEDALOV, A. I.

USSR/Engineering - Hydraulic Engineering, Dams

Apr 51

"Hydraulic Filling of Earth Dams by the Method of Transversal Sorting," P. D.  
Yevdokimov, Cand Tech Sci, A. I. Kontsedalov, Engr

"Gidrotekh Stroi" No 4, pp 28-30

Method consists of forced distribution of various-size particles of filling materials along cross section of dam, using chutes with several holes in their bottoms. Opening and closing of these holes is coordinated with discharge of materials from various openings in pipelines. Method is based on the factor that pulp in pipes contains different amts of solid component, and has varied coarseness along the pipeline.
